CRIMEVISIONAI

Empathy Map

Folder 1 | User-centered design hypothesis | Prepared 23 October 2026

Project: CrimeVisionAI — Multimodal Forensic Evidence Analysis and Investigation Support System

Document status: Project-specific draft based on the implementation information currently available. Verify placeholders and run-dependent results before formal submission.

1. Primary persona (hypothesis)

Persona: An investigator or forensic reviewer handling a case with several audio, image and video files. This persona is a design hypothesis for the prototype, not the result of a completed interview study.

2. Empathy map

Says	Thinks
“I need to review several files and find the relevant moments.”	“Can I trust this model output, and where did it come from?”
“I want the evidence and timeline in one place.”	“I need to distinguish what the media shows from what the AI infers.”

Does	Feels
Uploads evidence, checks transcripts and detections, compares timestamps, asks follow-up questions, and verifies important observations against source media.	May feel time pressure, information overload and concern about missing details or relying on an incorrect AI answer.

3. User needs translated into design

Need	Interface / workflow response	Validation question
One case context	Case selector and case-scoped evidence list	Can users identify which case an item belongs to?
Fast first-pass review	Transcription, object detection, captioning and candidate event extraction	Are outputs useful and are processing failures visible?
Traceability	Show source evidence and timestamps near generated observations	Can a reviewer return to the original media?
Honest uncertainty	Label model outputs as candidate observations, not facts	Does the UI avoid implying certainty?
Reliable Q&A	Answer from stored analysis and cite or identify supporting evidence where possible	Does it mention relevant entities and avoid unsupported claims?

4. Assumptions and research gaps

The persona and needs above are inferred from the project's purpose. Formal interviews, usability testing and feedback collection are not confirmed. Future evaluation should test the workflow with representative users and measure task completion time, missed observations, answer-grounding quality and perceived trust.

5. Design principle

Make the system useful as an evidence-review assistant while keeping the investigator in control. Every model-generated conclusion should remain reviewable against the original file and should never be represented as a definitive determination of guilt or intent.
