CRIMEVISIONAI

Customer Journey Map

Folder 2 | Investigator workflow | Prepared 23 October 2026

Project: CrimeVisionAI — Multimodal Forensic Evidence Analysis and Investigation Support System

Document status: Project-specific draft based on the implementation information currently available. Verify placeholders and run-dependent results before formal submission.

1. Journey overview

The journey below describes the intended workflow for a reviewer using the current prototype. It is a process model, not evidence of a completed usability study.

2. Journey stages

Stage	User action	System response	Pain point / risk	Design opportunity
1. Start / select case	Open dashboard and select or create a case	Case list and case APIs provide case context	Wrong case selection or unclear case state	Display clear case identifier and evidence count.
2. Add evidence	Upload audio, image or video	Validate supported file and store evidence record/file	Large files, unsupported format or upload failure	Show accepted formats, progress/error messages and size limit.
3. Analyze	Choose analysis for an evidence item	Call modality-specific pipeline	Model download/API error or long processing time	Show processing status and actionable failure details.
4. Review results	Inspect transcript, detections, caption and interpretation	Display model outputs associated with evidence	False detections, missing speech or speculative interpretation	Separate raw observations from generated hypotheses.
5. Reconstruct timeline	Review events in chronological order	Present timestamped events across evidence	Inconsistent timestamps or duplicate/missing events	Keep source ID/time and support verification against media.
6. Ask a question	Ask a case-level question	Case chat uses available analysis context	Answer may omit evidence or hallucinate details	Improve retrieval, grounding checks and source attribution.
7. Conclude / export	Review and document findings	Manual synthesis; report export not confirmed complete	No formal audit chain or export feature may be available	Add verified report generation and audit trail in future.

3. Critical trust moments

• File acceptance: clearly report what was stored and which analysis can run. • Model output: label it as a machine-generated observation. • Timeline: retain timestamps and source evidence references. • Q&A;: make supporting evidence inspectable and state when the answer is uncertain. • Export: do not imply evidentiary integrity or legal admissibility without a validated process.

4. Journey success indicators

Proposed measures: successful upload rate; analysis completion/failure rate; time to locate a known event; timestamp alignment error; Q&A; evidence coverage; unsupported-claim rate; and user-reported clarity. Collect these in a controlled test before reporting numerical results.
