CRIMEVISIONAI

Project Executable Files

Folder 7 | Submission checklist and local execution guide | Prepared 23 October 2026

Project: CrimeVisionAI — Multimodal Forensic Evidence Analysis and Investigation Support System

Document status: Project-specific draft based on the implementation information currently available. Verify placeholders and run-dependent results before formal submission.

1. Submission checklist

Item	Status	Notes
Complete source code	Required / verify	The uploaded ZIP is a documentation template, not the application repository.
README / setup guide	Prepared in this package; reconcile with source	Use actual repository instructions as source of truth.
requirements.txt	Verify in application repository	Do not invent dependency versions.
Database schema / seed	Reported / verify files	SQLite tables reported: cases, evidence, analysis_results; seed case CASE-2026-MVP-001 reported.
Environment example	Verify / add if missing	Provide variable names without real secret values.
Hosted URL	Not supplied	Do not claim deployed hosting.
APK / binary	N/A for web prototype	Local Python web application.
Docker configuration	Not confirmed / optional	Not required for local demo unless rubric mandates it.
Test files and results	Testing evidence incomplete	Attach functional tests and benchmark output after execution.
Demo video	Not supplied	Add link only after creating/uploading the demo.

2. Known project layout

Reported components include run.py, Flask application factory, Jinja2 templates, CSS/JavaScript assets, API handlers, data/crimevision.db, evidence/uploads and case-scoped uploads. The exact tree is not available in the supplied template ZIP. Replace this overview with the actual `tree` output from the CrimeVisionAI source repository before submission.

3. Access and repository details

Field	Value
Project name	CrimeVisionAI
Repository URL	[Insert actual GitHub URL]
Hosted URL	Not supplied; current baseline is local development.
Demo credentials	Not applicable / not supplied; do not invent credentials.
Runtime	Python + Flask; run.py reported as local entry point.
Demo video	[Insert link after recording, if required]

4. Local run procedure

1. Clone/download the actual CrimeVisionAI source repository. 2. Install the Python version documented by that repository. 3. Create and activate a virtual environment. 4. Install from the repository's requirements.txt. 5. Set required environment variables in a local .env file or shell, especially the Groq API key if used. 6. Ensure model weights and upload directories are available. 7. Confirm database initialization/seed behavior. 8. Start the documented entry point (reported as `python run.py`). 9. Open the local URL printed/configured by the app (reported as `http://127.0.0.1:5000`). 10. Test one small synthetic image/audio/video file. 11. Stop the server after the demonstration. Keep debug mode local only.

5. Known issues / limitations

Issue	Impact	Workaround / next action
Q&A may omit relevant detected entities	Answer may be incomplete	Verify answer against evidence and analysis records; add regression tests.
No speaker diarization	Cannot reliably attribute utterances to individual speakers	Label transcript as non-diarized.
Local model performance depends on hardware	Long processing times or memory pressure	Use small prepared demo assets; record environment.
PDF report export not confirmed	No verified one-click formal report workflow	Prepare manual documentation or implement and test export.
Debug mode in reported local config	Unsafe if exposed publicly	Bind to localhost; disable debug before any shared deployment.
No verified production chain-of-custody controls	Not suitable to claim forensic admissibility	Use as prototype / decision support only.
